Health score 81/100	Findings 3	Readiness LIMITED
-------------------------------	----------------------	-----------------------------

Executive Summary

The Meta advertising audit for Men's Running Shoes shows an overall health score of 81. The audit was conducted via manual upload for campaigns targeting Sales objectives across the United States, United Kingdom, and Canada, with a monthly budget of 500.

The current analysis is operating in a limited capacity due to incomplete data exports. With only one of the eight required reports provided, the findings regarding campaign structure and attribution should be treated as directional until a comprehensive data set is analyzed.

Confidence Notes

- Upload readiness is currently LIMITED. Only 1 out of 8 required reports was provided, which significantly reduces the depth of the analysis.

Top Priorities

1. Incomplete Report Coverage

HIGH META DATA-003

Some rules may be skipped or less confident until all required reports are uploaded.

2. Suboptimal Ad Volume

MEDIUM META STR-006

An average of 2 ads per ad set can slow creative learning and make winners harder to identify.

3. Limited Row Coverage

LOW META DATA-002

Recommendations are directional due to the low volume of data rows processed.

Quick Wins

Complete Data Upload

- Upload the missing reports listed in the readiness checklist.
- Run the audit again after the checklist is complete.

Adjust Ad Volume

- Keep roughly 3-8 active ads per ad set during testing.

Client-Ready Recommendations

Improve Audit Accuracy with Full Data Exports

The current audit is running in a limited mode because several key reports, including Campaign and Ad Set performance, are missing. This prevents a full analysis of bidding, budget allocation, and audience strategy.

- Export and upload the 7 missing reports identified in the checklist.
- Re-run the audit to unlock full insights.

Optimize Ad Creative Volume per Ad Set

The account currently averages 2 ads per ad set. This is below the recommended range, which can limit Meta's ability to test different creatives and identify the most effective assets for the Men's Running Shoes audience.

- Increase the number of active ads to between 3 and 8 per ad set.
- Monitor delivery to ensure spend is not overly fragmented.

Full Issue List

MEDIUM - Ad volume per ad set is outside the recommended range

STR-006 | META | Campaign Structure

Too few ads limits testing; too many ads can fragment delivery.

Impact: Can slow creative learning and make winners harder to identify.

Fix steps

- Keep roughly 3-8 active ads per ad set during testing.

MEDIUM - Meta audit is running with incomplete report coverage

DATA-003 | META | Attribution & Reporting

The audit can run in limited mode, but full confidence requires all required platform exports.

Impact: Some rules may be skipped or less confident until all required reports are uploaded.

Fix steps

- Upload the missing reports listed in the readiness checklist.
- Run the audit again after the checklist is complete.

LOW - Meta audit has limited row coverage

DATA-002 | META | Attribution & Reporting

The audit can run, but findings are less confident with very few rows.

Impact: Recommendations should be treated as directional.

Fix steps

- Upload additional report types or a fuller export when available.
